

## **New Polish Thermoforming Plant Plans Doubling of Capacity**

13 February 2002

In December, Amhil Enterprises opened a thermoforming plant to manufacture plastic disposable lids in a special economic zone in Zarnowiec, Poland. And now, after only a few months of operation, the plant is already expanding, with a doubling of capacity expected by April.

Zarnowiec is a tax-free area on the Baltic coast and gives the company efficient distribution throughout Europe and beyond. Amhil Europa is located 40km from a major container port at Gdynia and 200km from the German border.

Amhil is a full-service company from design to production and offers customers the use of thirteen patents. It even has registered its Fast-to-Market turnaround, from design to production capabilities. Headquartered in Mississauga, Ontario, Canada, Amhil manages the Contract Plastics Processing Group of Wentworth Technologies. The Group has three other processing plants in North America and Europe: Mississauga, Ontario, Canada, Dickson, Tennessee, U.S.A, and Bydgoszcz, Poland for injection molding.

Amhil produces over 5.5 billion thermoformed plastic parts per year in a wide variety of designs, including lids, dome lids, trays, and foodservice inserts. It manufactures plastic products in many of the most popular resin materials, including HIPS (high impact polystyrene), APET (amorphous PET), polypropylene, SBC/Crystal blends and PPO/polystyrene blends.
