The EFI EnFormer
Renovation Completed in
Technical Service Department

Electra Form Industries announces its newly renovated Technical Services Center. The center has been remodeled to accommodate increased injection press capacity, including a 600 ton Husky SX machine. The addition of this machine will bring a greater ability to service our customers on a large press format, and gives the PET industry alternatives when considering refurbishments and conversions of existing molds. The 600 ton press includes a three position take out robot and provides the ability to test PET injection molds before delivery to customer plants for qualification.

New 600 Ton Press adds capacity to testing and qualification

Complimenting the 600 ton press is a 300 ton Husky LX machine with three position take out robot. The 300 ton format has been a staple in the PET industry and this machine allows for qualifying molds that are new, converted or refurbished on this platform. Additional machines that are available for qualification include a 250 ton Cincinnati Milacron and a 150 ton Husky machine.

Newsletter Spotlight

The addition of this machine will bring a greater ability to service our customers on a large press format, and gives the PET industry alternatives when considering refurbishments and conversions of existing molds.

Prototyping is available on Electra Form Industries single cavity PET injection system. This machine can accommodate short production runs for preform development activities. Using this system allows for production style components on a prototype scale.

In addition to the injection machines, several blow molding machines are available and can be used to develop containers and qualify preforms.
